ESSE Endorsement for exocet® Fuel Additive

ESSE has been manufacturing oil burning cooking ranges and free-standing stoves since 1950. We have developed both vaporising and atomising type appliances over this time, both being capable of burning either kerosene or diesel.

Around the time of 2009 / 2010 our normally quiet aftersales phone lit up like a beacon (not literally) and we fielded calls from long standing ESSE oil burning customers who were complaining their appliances were sooting up and smoking out.

We spoke to contacts in the trade and found out there had been changes to the composition of the fuel delivered from the refinery. One customer reported he only ever cleaned his cooker and chimney out once a year, normally before the start of every heating season. He said he had done this same routine every year for forty years. Since the fuel had changed he was now cleaning his cooker out every six weeks!

We contacted Fuel Additive Science Technologies (exocet®), who quickly arranged a meeting here on site at ESSE Engineering Ltd. to discuss their oil additive products. We listened to their very knowledgeable conversation regarding the changes to the fuel and to how their additive performed to combat the new problems.

We tried a sample of their product in a local customer's cooker and witnessed the effectiveness first hand for ourselves.

Since this experience ESSE has always recommended using exocet® oil additive and now the aftersales phone is again sat happily gathering dust again.
